

I am uncertain about my ability to add all of the background animations that are a part of this game however my plan to tackle this project begins with establishing proper classes.

1. An abstract sprite class that accounts for x and y values as well as an image
2. A class for sonic that includes shifting his image as he does different moves and detects collision with other items (the ground, enemies, rings, walls, etc). This class will also hold the current number of rings, lives, current speed, etc
3. Classes for the 5 different enemies (Buzz bomber, chopper, crabmeat, moto bug, and newton). This will include their standard movement and attacks
4. A class for rings (mostly because there will be many at several different locations and I am hoping to build into the class the generation of the rings in their correct patterns based on the number of rings in a group)
5. A score class to keep track of points earned as the level is accomplished, mostly referencing information from other classes (rings and enemies)
6. The camera (in general Sonic stays at the center of the screen but there are times where that isn't the case so if possible I want to include that functionality. . .my research tells me that is likely to be the hardest part).
7. A power-ups class for the different shields, or speed shoes, that sonic can use
8. A level class to load the map for the level

I will also be keeping track of time in seconds

Physics for the game (I am planning on using [this resource](#) to help with that)
